

## ABS Production Mobile

- **For production specialists active around the globe**
- **For Android phone and tablets**
- **Remote download and upload of (to be) registered field activities**
- **Stand-alone registration of field activities**
- **Expectations on harvests, diseases, field activities on your productions**
- **Including advanced features as GPS, photo's, drawings and split fields**
- **Security through passwords, user authorization and device identification**
- **Build for Android for 3G and GPRS network (mobile phone)**
- **Online implementation and easy-to-use.**
- **No costly investments on hardware devices**

### Function

ABS Production Mobile brings the ABS solution directly into the production field. You can download the field books of several productions from your centrally located server onto your mobile device based on user, location or grower. The production specialist can view his activities in his personalized work list. After the field inspection the registered data can be uploaded automatically or by manual instruction.

### Connectivity

You don't need an internet connection with your database server in the field. As long as you have loaded your field books while under coverage of a 3G or GPRS network for mobile phones, you can leave the area and do your inspections offline. Therefore also remote areas are covered with this solution. Even when you are out of reach of the mobile network, your GPS location tracker will keep identifying the production field where you are standing.

### Set up and use

The implementation is simple and the user interface is kept very logic. On average one can use this solution with very little training. Every additional device can be identified in the system by your own application manager. In case your device has to be renewed during your trip (in case the device is stolen or broken down) you can easily make a new remote setting for the new device.
